DBLog has announced the launch of YachtPro Captain, a software specially created for yachts refit management. DBLog is a software developer firm based in Monte Carlo, Monaco.

“Yacht Pro Captain is a software solution that has been designed to facilitate duties of a captain and his project management and engineering team during refit planning and implementation processes,” the company explains.

Available offline or in a cloud-based made, YachtPro Captain is a tool to plan, optimize, execute and follow-up refit and maintenance works on board.

Accurate analysis

One of the unique features of the YachtPro Captain, DBLog claims, is an integrated tool allowing for comparison of quotations from different shipyards according to a worklist. This has been designed to ensure an accurate analysis of estimated costs, therefore an optimized budget planning.

In addition, an integrated project management module serves as a primary instrument for scheduling works assigned for each supplier with a special colour-coding feature.

Paying a very close attention to ergonomic details of the software, DBLog says it could design a solution, which supports different formats.

“The historical overview of operations and quotations ensure timely and cost-effective decisions can be taken by a captain or a project manager,” the company concludes.
